Wireless charging of electric buses

Wireless charging of electric buses to be put to real world test in Germany.

Regional German transport operator Rhein-Neckar-Verkehr GmbH (RNV) is set to carry out a pilot project to test the viability of wireless inductive charging technology of electric buses. The trial will see two electric buses fitted with Canadian transportation manufacturer Bombardier's PRIMOVE inductive charging technology, which will enable them to be recharged wirelessly as they let passengers on and off at bus stops along the inner city route 63 in Mannheim, Germany
